

Long-term data sets you may
wish to examine...
The Chesapeake Bay and its
major fisheries.

Roger Mann
Virginia Institute of Marine Science

The coastal bodies of water in the Mid-Atlantic area have higher temperatures than almost all other bodies of water in the world. There also is enormous variation in landscape in this area. Thus, these are ideal locations to study the effects of climate change.

Chesapeake Bay facts

- 10,000 years old
 - 298 km long
 - 8484 sq km area
 - $71.5 \times 10^9 \text{ m}^3$ volume
 - 165,700 km² watershed
- The upstream problem*
- 15 million people, add 3 million more by 2025
 - 90% forested watershed in colonial times, 60% now

map copyright: Chesapeake Bay Foundation

The Chesapeake Bay probably is the most studied watershed in the continental United States. Available data range from river flow data to nutrient data to fisheries data.

This picture shows oysters outside an oyster shucking house in the 1930s. The man in the picture is 6 feet tall.

There is extensive current information of major species and their habitats. These data sets are often decades in length.

Consider clams and oysters as resources, habitat and prey.

In addition to general descriptions we can quantify suites of physical variables, place them in context of sea level rise, hurricane induced storm surges, and precipitation events in the watershed.

QuickTime™ and a
TIFF (Uncompressed) decompressor
are needed to see this picture.

We have invasive species - *Rapana venosa*

- Arrived 1998
- Documented distribution through a bounty program with 150+ commercial fishermen - equivalent to >100,000 sampling events/yr.
- Well described early life history.
- Working on prospective range extension models for the Chesapeake Bay and subestuaries..

Where are they now?

- The distribution has changed only a modest amount, approximately 90% remain in the epicenter as recorded in 1998.
- This is a well established population with multiple year classes. Over 9500 are shown in a demographic for 1998-2004 collections. They are breeding, sustained collections are made each year, and current total (spring 2007) is >14,000!
